

## Soundex and Metaphone Batch Calculator

This application will scan a list of names and calculate a Soundex or Metaphone code for each name.

A list of up to 32000 names can be calculated on a 32bit computer.

A 64bit computer should be able to manage 64000 names.

### How to use it.

1. Copy and paste your list of names into the '**Input**' box.
2. Select the Algorithm ( **Soundex** or **Metaphone**).
3. Choose the separator. *Tab is the default separator.*  
*A tab or comma separator is best if you want to paste into a US or British spreadsheet.*
4. Select the code length. (4 to 8)  
*The standard length for soundex is 4. Metaphone is good at 6.*
5. Click the '**Calculate**' button, and the results will show in the results box.
6. Click '**Copy**' button to copy the result list onto your clipboard.
7. Paste the copied result to where ever you want it.

Each time you click the 'Calculate' button, the results will be refreshed.

The '**Copy**' button will select all items in the 'Results' list and copy them to the clipboard.

To clear all boxes, click '**Clear**'

The '**Separator**' selection allows you to choose which separator you want to use in the result list.

Tab is the default separator. A tab or comma separator is best if you want to paste into a US or British spreadsheet.

Some european spreadsheets require a semicolon separator.

This Soundex and Metaphone Calculator is free for private and none commercial use.
