FireLiner

Version 2.0
Updated 6/12/01

About This Manual

This user manual is a work in progress. We have tried to make the software as user friendly as possible, and if you are already familiar with the terms and concepts used, then the software is pretty much self explanatory. Most material in Fireliner is derived from the Fireline Handbook. Until we have written the "perfect user manual", please feel free to email or call us and ask any question that arises.

We will be posting a list of frequently asked questions and more tutorial information on the web site as soon as it is available.

General Information

In most numeric input fields, you can use the up and down scroll buttons to increment and decrement the values. Just tap in the field you want to change first, then use the buttons.

When FireLiner is first launched, you see the Startup screen. Just tap the "MENU" button (or with version 3.5 or later of PalmOS, tap the "FireLiner" label at the top of the screen) to see all your menu options.

Version 2.0 of FireLiner has been restructured, and the hydraulics equations that were present in version 1.x have been removed. The FireHose program contains those same hydraulic functions and more. FireLiner has been reduced in price to reflect this, but we added a few more features just for wildland firefighters.
