# HoRNet TrackUtility

TrackUtility is a swiss army knife for audio, it features different useful processors that you would otherwise need to find loading many plugins in a handy small GUI that you can keep on your screen together with other plugins.

When you need to change a track from stereo to mono, remove DC, pan, trim, etc. TrackUtility is there for you.

Thanks to the limiter in the output section, the stereo wideness control and to the auto gain RMS mode TrackUtility is also very useful on the master bus for quick mastering. Set the RMS to your desired maximum level, engage the auto gain and the limiter. Set the stereo image to taste, here is a quick mastering recipe.

Selects the source channel for processing (Left and Right, Left, Right, Stereo swap)

Enables DC filtering

Enables track muting

Output RMS meter

Output peak meter

Inverts the Right channel phase

Inverts the Left channel phase

Selects the auto gain mode (peak or RMS)

Enables the Auto Gain mode

Sets the Gain level from -60dB to +60dB, with auto gain on, a double click will reset it

Sets the auto gain level

Sets the stereo image wideness

Sets the track panning

Displays the peak RMS value, a click will reset meter

Displays the peak value, a click will reset meter

Enables the output clipper

Enables the output limiter
