

General

This is a Xbase++ Class for easy the use of LibXL.DLL

You will find the method list in the source code. Documentation and help for LibXL is on the LibXL homepage www.libxl.com . The C++ dokumentation suites best for parameters, because of the parameter type and count. The method names are build with the C++ class name and function names, because of some reserved words in Xbase++.

C++ class book, funktion load => method BookLoad of class xlBook.

You can use hHandle (hBookHandle) or objects (oBook from xlBook class) as parameters the method will handle that. If a function in LibXL will return a handle (hBook, hSheet etc.) these methodes deliver a Object (oBook, oSheet), so easy to use.

Examples

There are Test*.PRG, look inside what is tested, you can send my new short examples if you want.

Warranty

I am NOT responsible for any code or damage.

What you need

- Xbase++ 1.90.x or newer
- OT4XB.DLL from www.xbwin.com
- LibXL.DLL from www.LibXL.com

Versions

1.00 - LibXL 3.5.3 from 2013-12-04

First release, not all is tested, but I did not find errors inside.

1.01 - LibXL 3.5.3 from 2014-01-17

Some minor error removed (miss typing words, variable names etc.).

Test2.PRG enhanced with a formula example => function names like in VB-macros !
