

To change skins:

Open settings.spt file using Wordpad or any other text editor capable of displaying xml type code. Windows Notepad is not a good code editor.

Find the entry:

```
<Skins>  
    <SkinToLoad: "max", string>  
</Skins>
```

Replace "max" with "default" and save the file.

On the next start the old default skin will be loaded.

You can make your own custom skin by creating alternate graphics (see the skins sub folders) and editing the gui.xml file.

Graphics should be saved in 32bit png format. For each skin a complete folder with all the needed graphics and gui.xml should be created.

*gui.xml notice:

Some of the entries in gui.xml (color format) don't follow strict xml rules. Do not let your xml editor auto-correct "errors", or incorrect colors will be displayed.
