Introduction

Usually, changing picture size for multiple images can be an hazzle. It would be even worse if different image format, say, GIF(.gif) and Bitmap (.bmp), are needed to be rescaled at once. **JpegWatch Desktop** is specifically made to solve the problem. Not only it accepts most common image formats, but also provides a very easy way to do processing on multiple image files.

Using **JpegWatch Desktop** is as easy as filling blanks. Give it some input files, choose settings, and select where output files would go. **JpegWatch Desktop** would do the rest for you. The result image files will be in JPEG format.

Add Files Window

In this window, you can add files to be processed. **JpegWatch Desktop** will filter out invalid files and only accepts image files it recognizes. The application accepts Windows Bitmap (.bmp), GIF(.gif), and

JPEG (.jpg/.jpeg) image files.

There are two ways to add files. One is click on "**Add Files...**" button to choose a folder. The other is just **drag-and-drop** folders and files to the window.

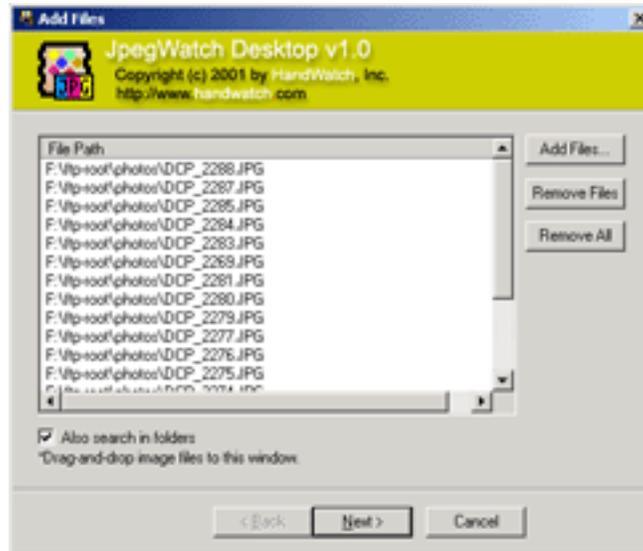

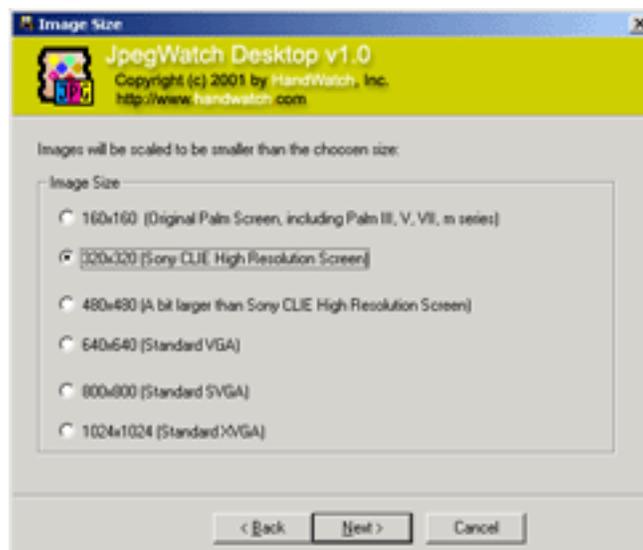

Image Size Window

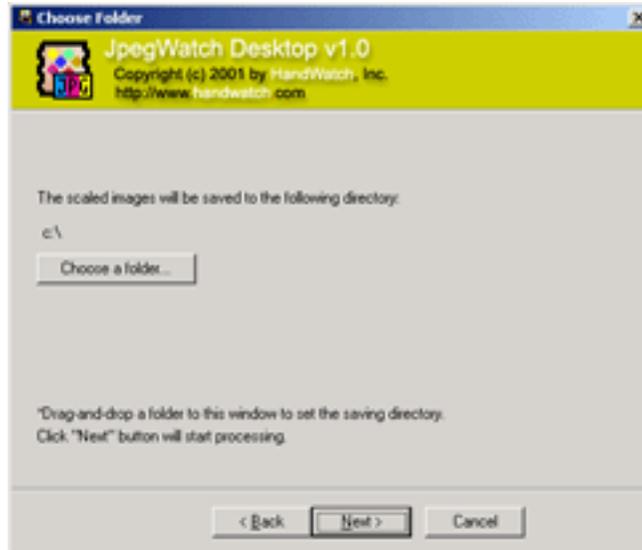

Image Size Window is where you select the desired image size. If the source image is larger than the specified size, it would be scaled to be smaller than or equal to the size chosen. The larger the image size, the larger the file size.

To optimize image size to be viewed by **JpegWatch** on Palm devices, it's recommended to select size to be smaller than 640x640.

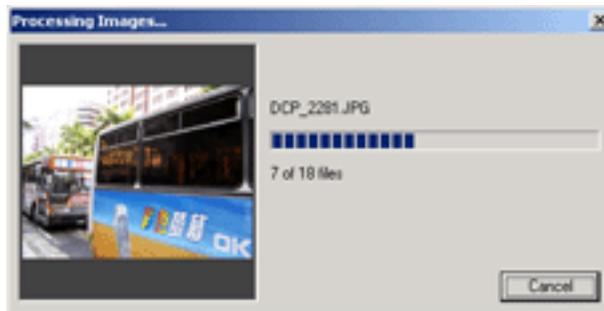

Destination Window

You can choose where to save the result image files in **Destination Window**. As in **Add Files Window**, there are 2 ways of picking a folder. One is simply use "**Choose A Folder**" button to select a folder, the other is drag-and-drop a folder to the window.

Processing Window

When processing, this window shows the preview and information about the image file currently being processed. It also shows the number of images left to be processed.

Finish Window

Finish Window is presented when the batch process is done. Click on "**Process More Files**" button if you want to process more files.

If you found JpegWatch useful and have not registered, please click on "[Buy JpegWatch for US\\$19.99](#)" link to purchase JpegWatch.
