

# Simple Stutter

[Simple Stutter](#) is a stuttering plugin for PC which will appear to freeze the audio buffer thus giving you that classic & distinctive sound effect used in many dubstep/dnb and mainstream popmusic tracks.

Simple Stutter is the culmination of many months of development & beta testing, yes I use the Synthedit platform to build plugins, but as many SE developers know it's “almost” impossible to build a fully functional stutter/freeze plugin with SE, so for that reason I believe Simple Stutter is cutting edge.

Simple Stutter samples incoming audio & loops it continuously, then you control the speed via “Initial Speed” and the Pitch+Spd slider.

**(Simple Stutters Bigger Brother)**

The Stutter button is for previewing and live gig use. It's great fun to play with, but trying to record automation directly by clicking stutter with your mouse will usually result in undesirable results. If you wish to use the Stutter button to record automation, trigger it via midi.

The controls Stutter & Pitch+Spd can be automated & can also be assigned midi ccs, just right-click a control and select “edit”. To move the pitch+spd slider by fine increments/decrements, just hold the Ctrl key whilst moving the slider. Turning the Initial Speed knob to the left increases the stuttering speed & turning the knob to the right decreases speed.

## Midi

To assign midi cc numbers just right-click on a slider or button & select “edit”.

## Tips

For optimal results when using the pitch+spd slider, it's best if the “initial speed” speed knob is set to the 11 – 12 o clock position.

If audio ever stops or there's just silence or is distorted whilst not using the stutter button, clicking the Stutter button will restore it.
