3.6	Exit Codes	22
4.	Support	23
4.1	Reporting Problems	23
4.2	Contact Information	23

1. Introduction

1.1 An Introduction to PDFTron XPSConvert

PDFTron's XPSConvert is an easy-to-use, multi-platform command-line program that provides users with an efficient way to convert XPS or OpenXPS documents into PDF as well as image formats (such as PNG, TIFF, BMP, and JPEG).

XPSConvert enables high-quality conversion from XPS to PDF that maintains the original document quality and preserves hyperlinks, colors and fonts. The resulting self-contained and compact PDF and image files can be distributed, viewed, edited, archived, printed, and published. The conversion also offers a wide range of options to control the output file size and image quality.

Like other PDFTron products, XPSConvert does not rely on Microsoft .NET platform or any other third party components. The technology is suitable for use in high-throughput server environments and is also available as a component for integration with third party applications.

1.1.1 Key Functions

- Convert XPS or OpenXPS to PDF
- Convert XPS or OpenXPS to PNG, PNG8, JPEG, TIFF, TIFF8, TIFF (G3/G4 CCITT Fax) BMP, and RAW.
- Full support for XPS and OpenXPS specifications.
- Batch conversion.
- Conversion support for unzipped XPS folders.
- Preserves embedded fonts, ICC profiles, and hyperlinks.
- Multi-page Tiff export.
- Dithering control for 1 bit per pixel and palletized image formats.
- Wild card and subfolder processing.
- Adjustable output resolutions for raster image output.

1.1.2 Common Use Case Scenarios

- Developers may want to use XPSConvert to quickly add XPS support to any applications or workflows that support PDF.
- Server-based, on-demand conversion of XPS documents to PDF files or raster images.
- Batch processing of PDF collections with same rasterization options. XPSConvert is particularly useful in assembling product catalogues and brochures.
- Thumbnail generation for XPS documents.

1.1.3 Operating Systems Supported

- Windows 7, 2008, Vista, XP, 2003, 2000, NT, 98
- Mac OSX
- Linux

1.1.4 System Requirements

- At least 10 MB of free disk space.
- Memory requirement is dependent on source document being converted.

2. Installing and Uninstalling XPSConvert

2.1 XPSConvert Installation

XPSConvert Command-line Application is supplied as a download from a distributor or directly from www.pdftron.com. The release is packaged as a .zip file (XPSConvert.zip). To install the software, simply unzip the archive in the desired location and make sure to preserve the directory/folder structure during this process. To register the software, copy the license file provided to you into the “XPSConvert” folder.

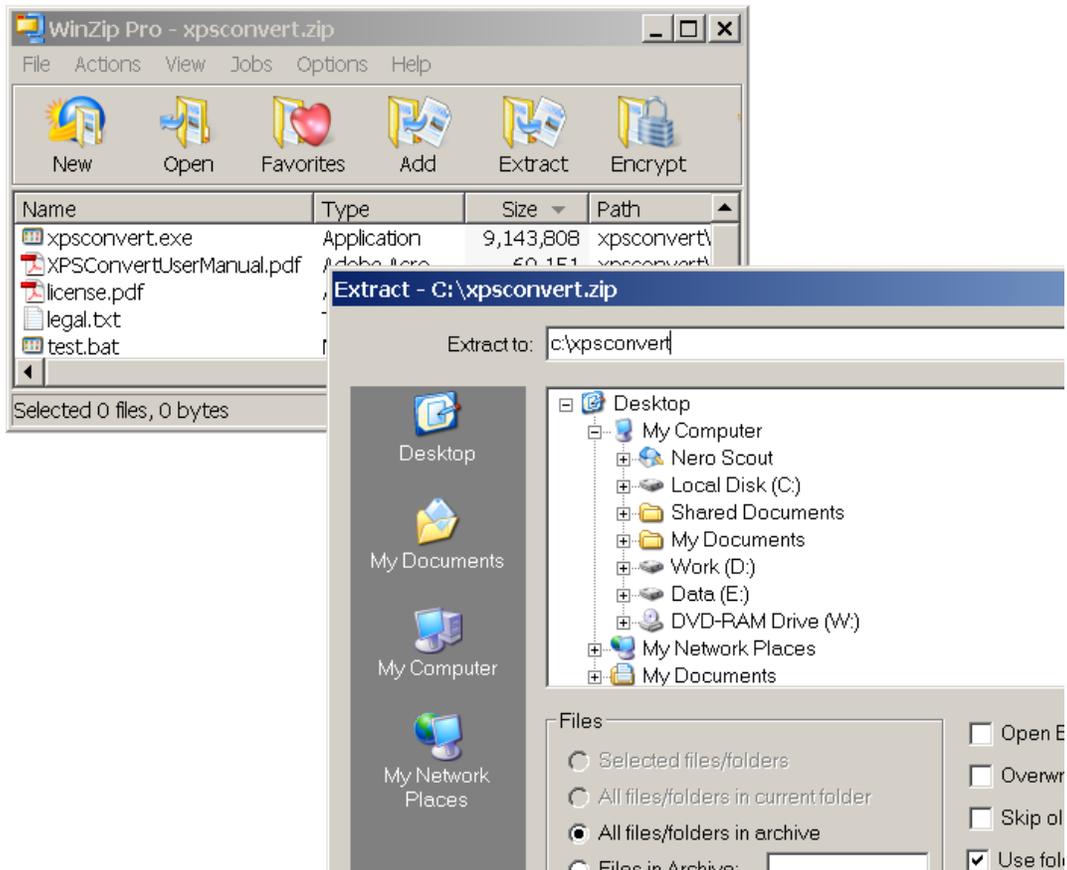

Figure 2.1 – Extracting XPSConvert Archive using WinZip

2.2 Demo Version Installation

If you wish to evaluate the product, you can download the demo version of the product without any serial number or license key.

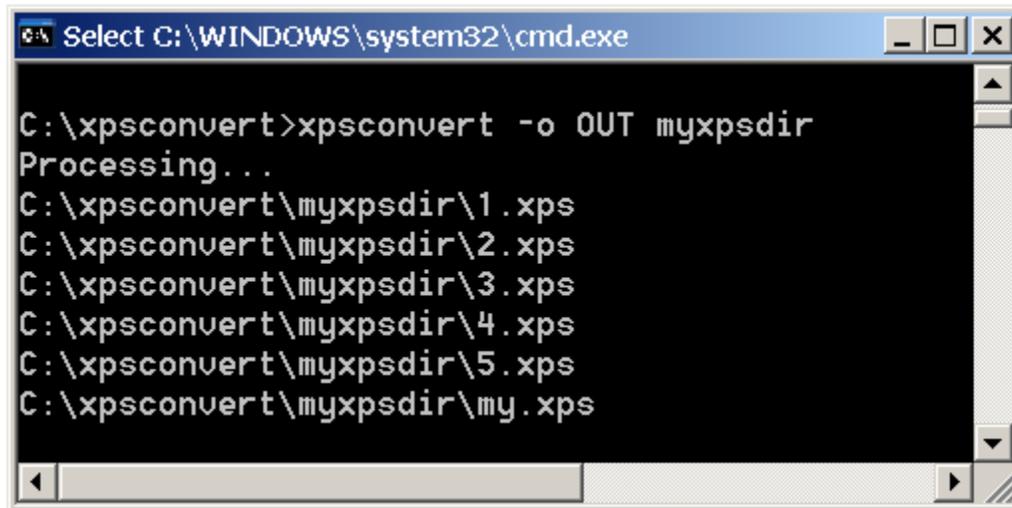

To do this, go to PDFTron’s **Downloads** page at www.pdftron.com/downloads.html. Click on the appropriate product name/version. This will bring you to the link to the page to download the demo. Download the zip file (XPSConvert.zip) and extract the archive in the desired location, while making sure to preserve the directory (folder) structure when extracting the archive. Download the zip file *xpsconvert.zip*. Extract the archive in the desired location (making sure to preserve the folder structure). This will provide you a working copy of the application along with various examples. The limitation of the evaluation version is that all output pages will have demo stamp.

2.3 Uninstalling XPSConvert

To remove XpsConvert from your computer, simply delete the “xpsconvert” folder.

3. Overview

PDFTron XpsConvert is a command-line application designed to convert XPS documents or XPS uncompressed folders to one or more PDF, BMP, PNG, JPEG, TIFF, or RAW files while presenting several options to control resolution, color, and quality depending on the output format selected. This section covers the basic usage of XpsConvert explaining all of the available options.

```
C:\WINDOWS\system32\cmd.exe
C:\xpsconvert>xpsconvert -o OUT myxpsdir
Processing...
C:\xpsconvert\myxpsdir\1.xps
C:\xpsconvert\myxpsdir\2.xps
C:\xpsconvert\myxpsdir\3.xps
C:\xpsconvert\myxpsdir\4.xps
C:\xpsconvert\myxpsdir\5.xps
C:\xpsconvert\myxpsdir\my.xps
```

Figure 3.0 XpsConvert Command-line Application.

3.1 Basic Syntax

The basic command-line syntax is:

```
XpsConvert [options] file1 file2 folder1 file3 ...
```

--physical_model		<p>Specifies the physical model of the xps files to process. The following is a list of supported physical models:</p> <ul style="list-style-type: none"> ■ zip (the standard format of xps files) ■ dir (directories packaged like xps files) ■ all (both zip files and directories) <p>The default physical model is zip.</p>
--nosmooth		Disables image smoothing.
--extension	--extension ".xps"	The default file extension used to process PDF documents. The default is ".xps".
-h or --help		Print a listing of available options.
-v or --version		Print the version information.
--verb	--verb 2	Set the verbosity level. Valid parameter values are 0, 1, and 2. The higher number results in more feedback. The default is 1.

The following command line options apply only to image conversion:

Option	Parameter	Description
--digits	--digits 4	The number of digits used in the page counter portion of the output filename. By default, new digits are added as needed; however this parameter could be used to format the page counter field to a uniform width (e.g. myfile_0001.png, myfile_0002.png, etc).
-d or --dpi	-d 300	The output resolution, from 1 to 1000, in Dots Per Inch (DPI). The higher the DPI, the larger the image. Resolutions larger than 1000 DPI can be achieved by rendering image in tiles or stripes. The default resolution is 92 DPI.
--hres	--hres 100	The width of the output image, in pixels.
--vres	--vres 100	The height of the output image, in pixels.
-c or --clip	-c 216,522,330,600	User definable clip box. By default, the clip region is identical to the current page 'box'.
-g or --gray	--gray	Render and export the image in grayscale mode. Sets pixel format to 8 bits per pixel grayscale. By default, the image is rendered and exported in RGB color space.
-k or --cmyk	--cmyk -f tif	Render and export the image in CMYK mode. To export CMYK, the output image format must support CMYK pixel format. An example of image format that supports CMYK is TIFF (e.g. -f tif -k). By default, the image is rendered and exported in RGB color space.
--mono	--mono	Export the rendered image as 1 bit per pixel (monochrome) image. If the output format is TIFF, the image will be compressed using G4 CCITT compression algorithm. By default, the image is not dithered. To enable dithering use '--dither' option.
--dither	--dither	Enables dithering when the image is exported in palletized or monochrome mode (e.g. when export format is tif8, png8 or --mono).

- **png8** – (Palletized PNG)
- **jpg or jpeg** (Joint Photographic Expert Group)
- **tif or tiff** (Tagged Image File Format)
- **tif8** – (Palletized TIFF)
- **bmp** (Windows Bitmap Format)
- **raw** (raw RGB or Gray data)

3.3.4 How do I specify which pages to convert?

By default, XPSConvert will convert all XPS pages to the output format. You can specify a subset of pages to convert using the ‘-a’ or ‘--pages’ options. For example:

```
xpsconvert -a 1,3,10 in.xps
```

will convert only pages 1, 3, and 10. Please note that XPSConvert assumes that all pages are numbered sequentially starting from page 1.

To specify a range of pages, use dash character between numbers. For example:

```
xpsconvert -a 1,10-20,50- in.xps
```

will render the first page, pages in the range from 10 to 20 and all pages starting with page 50 to the last page in the document.

All even pages can be selected using the ‘e’ (or ‘even’) string. For example, the following line renders all even pages:

```
xpsconvert --pages even in.xps
```

Similarly odd pages can be selected using the ‘o’ (or ‘odd’) string. The following line renders all odd pages in the document and every page in the range from 100 to the last page:

```
xpsconvert --pages odd,100- in.xps
```

3.3.5 How can I rotate pages?

The resulting rotation can be modified using the ‘-r’ (or --rotate) option. For example, the following line rotates all pages 90 degrees counterclockwise:

```
xpsconvert --rotate 90 Test/tiger.xps
```

Similarly, the following line rotates the page 270 degrees counterclockwise (or 90 degrees clockwise):

```
xpsconvert --rotate 270 Test/tiger.xps
```

3.3.6 How do I convert unzipped XPS files?

By default, XPSConvert will convert XPS files if they are in zip format. You can convert directories in XPS format by using the option --physical-model. For Example:

```
xpsconvert --physical_model dir xps_dir
```

In this example ‘xps_dir’ could be created by unzipping an XPS file. This directory would contain files with XML markup and other XPS resources.

The “--physical_model” parameter accepts any of the following output formats:

- **zip** (xps parts contained in a zip archive)
- **dir** (xps parts contained in a directory)
- **all** (processes both zip files and xps directories)

3.3.7 How do I batch convert files?

XPSCovert supports batch conversion of many PDF files in a single pass. To convert all PDF files in a given folder(s) you can use the following syntax:

```
xpsconvert myfolder1
```

The '--subfolders' option can be used to recursively process all subfolders. For example, the following line will convert all documents in 'myfolder1' and 'myfolder2' as well as all subfolders:

```
xpsconvert --subfolders myfolder1 myfolder2
```

By default, XPSCovert will convert all files with the extension '.xps'. To select different files based on the extension use the '--extension' parameter. For example, to convert all XPS documents with a custom extension '.blob', you could use the following line:

```
xpsconvert --extension .blob --subfolders myfolder1
```

The use of wild characters is also allowed. For example, to convert all XPS files starting with 'x' in the current folder use:

```
xpsconvert x*.xps
```

3.3.8 How do I convert XPS to multi-page TIF?

If your output format is TIFF, you can convert XPS to a single, multi-page TIFF document instead of a separate file for every page using the '--multipage' option.

For example:

```
xpsconvert --multipage -f tif --verb 3 myxps.xps
```

3.3.9 How do I create grayscale images?

By default, XPSCovert uses the RGB color model for rasterization and image export. You can instruct XPSCovert to use single channel Device Gray color model for rasterization and image export using the '--gray' option. For example:

```
xpsconvert -f tiff --gray in.xps
```

3.3.10 How do I specify the resolution of the output image?

Using XPSCovert output image resolution can be specified explicitly (using the '-d' or '--dpi' option) or implicitly (using the '--hres' and '--vres' parameters). In this section, we cover the use of the '--dpi' parameter. For more information on the '--hres' and '--vres' parameters, see 'How do I specify dimensions of the output image in pixels?'

By default, XPSCovert uses resolution of 92 Dots Per Inch (DPI), which is the typical screen resolution. Smaller DPI numbers result in smaller images (e.g. suitable for use as thumbnails), while larger DPI numbers generate larger images (e.g. suitable for high-quality output).

4. Support

4.1 Reporting Problems

If you encounter a problem or question regarding PDFTron XPSConvert, which is not addressed on PDFTron's website, please submit a problem report to PDFTron's Support group at <http://www.pdftron.com/reportproblem.html>.

When submitting a problem you will be asked to provide the following information:

- Contact details
- Product and Version of the product
- Detailed description of problem
- Problem file(s)
- Whether you have an AMS (Annual Maintenance Subscription)
- Any other information that may be related

4.2 Contact Information

To contact PDFTron directly, please use the contact information below:
