MultiTail 5.0.1

by Folkert van Heusden   - Thu, Apr 26th 2007 11:25 PDT

About: MultiTail lets you view one or multiple files like the original tail program. The difference is that it creates multiple windows on your console (with ncurses). Merging of 2 or more log files is possible. It can also use colors while displaying the log files (through regular expressions) for faster recognition of what is important. It can also filter lines (again with regular expressions). It has interactive menus for editing given regular expressions and deleting and adding windows. One can also have windows with the output of shell scripts and other software. When viewing the output of external software, MultiTail can mimic the functionality of tools like 'watch'.

Changes: A segfault in the 'find' code has been fixed. --mergeall would merge all the following files into the previous window. This may be unwanted, so '--mergeall-new' has been added, which creates a new window in which all the following files up to --no-mergeall are merged. Conversion schemes/color schemes selection would fail if no schemes were defined in the config file. On certain terminals one needs to explicitly set the background color to be usable. Version 5.0.0 always remembered the last search string; this can now be turned off in the config file. Major bugs on the (IBM) AIX platform have been fixed.

PunBB Discussion Forums JumpBox Beta 1.0 RC2

by Grid7 - Thu, Apr 26th 2007 11:23 PDT

About: PunBB Discussion Forums JumpBox is a virtual appliance that bundles an installation of PunBB with all of its dependancies (database, operating system, libraries, and management interface) into a single pre-configured unit. This makes deploying PunBB very easy and gives you a working discussion forum in minutes instead of hours. PunBB is a lightweight discussion forum that provides the essential features to host a thriving community. It has fewer bells and whistles than other forum applications, but it has an intuitive user interface and renders XHTML-compliant output.

Changes: Updated to the latest version of PunBB. The amount of screen real estate taken by the JumpBox navigation has been reduced. Navigation can now be easily removed after the JumpBox is registered. A tool was added to the JumpBox Administration UI to enable configuration of proxy server settings. The JumpBox Administration UI has been redesigned to have a cleaner look.

VMware 6.0 Beta Release Candidate Build 44426 (Workstation Development)

by Moritz Barsnick   - Thu, Apr 26th 2007 11:17 PDT

About: VMware allows you to run 'virtual machines' inside a Linux host. It is not an emulator. It provides a virtual computer within the host which can boot whichever OS you decide to put on the filesystem image that is used as a harddrive. It will run DOS 6.22, Win 3.1, Win9x, WinNT/2000/XP/2003, Linux, Novell, and more. The only main requirement is a 400 MHz or better machine, along with lots of RAM (128M minimum, 256M recommended).

Changes: ACE authoring capabilities were introduced. This release candidate runs faster due to the omission of debug code.

BibleTime 1.6.4

by Joachim - Thu, Apr 26th 2007 11:16 PDT

About: BibleTime is a Bible study tool with versions for KDE 3.x. It is based on the Sword library, which provides the functions to access modules like bibles, lexicons, books, and commentaries. BibleTime provides an easy-to-use but powerful interface.

Changes: This version contains several bugfixes, especially in the search tool. It also contains updated translations and a new translation to Chinese.

Open Blue Lab 1.1.3 (Financial / Budget)

by Myriam - Thu, Apr 26th 2007 11:13 PDT

About: Open Blue Lab is a modular ERP, built on a plugin architecture. Each business domain (such as Groupware, Financial, HCM, PLM, or SCM) is separated into subdomains which are implemented through plugins. This architecture permits you to choose only the components that suit your needs. Each plugin is certified Zero Code, configurable through a GUI, and may be adapted through the UML models provided.

Changes: Changes in class diagrams: views and layout definition have been added, and some classes and associations have changed a little.

Cubulus OLAP 0.48

by alxtoth   - Thu, Apr 26th 2007 11:10 PDT

About: Cubulus is an analytic engine and a slice and dice Web interface on top of a relational database (MySQL and SQLite at the moment). It caches calculated cells, and is able to parse basic MDX queries.

Changes: Hierarchy menus are opened with a click (mouse over was annoying). The default database is SQLite (it does not support partitions, so indexes are used). A small database is included (only December 2006 data). Libraries included. Hopefully, this release is a one-click install.

Ivy 2.0.0-alpha-1

by Xavier Hanin   - Thu, Apr 26th 2007 11:09 PDT

About: Ivy is a simple but powerful dependency manager. Its key features are ease of use, extreme flexibility, easy extensibility, Ant integration, and transitive dependencies. It is ready to use with the Maven ibiblio repository. It eases continuous integration, and makes your software component a lot simpler to use.

Changes: This is the first release of Ivy in the Apache incubator, focusing on refactoring the code to get better readability, renaming packages to org.apache.ivy, improving Maven 2 compatibility, and other bugfixes and improvements.

TYPOlight webCMS 2.3.0

by Bernhard J. M. Gr#n   - Thu, Apr 26th 2007 07:43 PDT

About: TYPOlight webCMS is a powerful Web content management system that specializes in accessibility and uses XHTML and CSS to generate W3C/WAI compliant pages. Its key features include a live update feature, multi- language support, automatic CSS framework generation, a file manager, a search engine and form generator, versioning and undo, and Web 2.0 support.

Changes: Polish and Russian translations were added. A development module was added to show how to write your own modules. A source editor was added to the file manager. It is now possible to create forms without tables. The image script was improved, so it is now able to handle transparency. The module handling in the backend and the style sheet import were improved. There are many other improvements and some minor bugfixes. You can update to this version using the live update feature.

Myrinix - Digital Home Edition 2007-04_3 (KDE)

by Ang Tun Chek   - Thu, Apr 26th 2007 07:42 PDT

About: Myrinix - Digital Home Edition is meant to be a smart and centralized OS that can be implemented in a home environment. It can be connected to a TV or other large screen to record and play DVD movies and surf the Internet. It also implements video sharing with the NX technology, and includes the videolan program for broadcasting video or music throughout the network. Diskless client computers can connect with the server as it performs other tasks. Myrinix - Digital Home Edition is a bootable Linux live CD derived from Kanotix.

Changes: This release fixes a DBUS hang at startup on some computers. Detecting a USB drive as home at startup was fixed. This release also added an easy USB portable drive installer and a locale changer for quick and easy language changes.

BEST OF BREED

About: Smilehouse Workspace is a Java based e-commerce application for product, order, and customer information management. It can be used for building and managing product catalogs, online stores, Webshops, and b-to-b extranets. It currently runs on Tomcat and has two Web-based interfaces. The first is a themed interface visible to the public, and the second is a separate administration interface for managing both the appearance and content of the published service (users and customers, product information and related files, order information).

Changes: Some remaining problems with MySQL 5 support have been fixed. Eight new ready-made themes were added. Customer data now contains last modification dates.

TOPCASED 1.0.0M3

by Pierre Gaufillet - Thu, Apr 26th 2007 06:27 PDT

About: TOPCASED (Toolkit in OPen source for Critical Applications and SystEm Development) is a system/software engineering workshop based on Eclipse. It aims to provide the tools required to go from requirements to the implementation stages. The current version includes several graphical editors: ECORE, UML 2, structured analysis, and AADL (Architecture Analysis and Design Language). These editors are partially generated from ECORE models and models can be checked (OCL and EMF checks are supported at this time). External tools can be easily connected to the workshop thanks to a simple communication bus.

Changes: This release includes a switch to Eclipse 3.3M5eh, EMF 2.3, and Java 1.5, a new model search feature, and bugfixes.

MOSIX Cluster and Grid Management 2.21.0.0 for Linux 2.6.21 (Linux 2.6)

by A. Barak - Thu, Apr 26th 2007 06:25 PDT

About: MOSIX is a management system for Linux clusters and organizational grids that provides a Single-System Image. In a MOSIX based system, there is no need to modify or link applications with any library, copy files, login to remote nodes, or even assign processes to different nodes; it is all done automatically. Just "fork and forget", like in an SMP.

Changes: This release uses version 2.6.21 of the Linux kernel.

phlyMail Personal Edition 3.06.08

by Matthias Sommerfeld   - Thu, Apr 26th 2007 06:25 PDT

About: phlyMail is a Webmail and data hosting application. It features folders, unlimited POP3/IMAP profiles, quotas, an integrated address book, SMS support, themes, and multilingual support. It uses either sendmail or SMTP to send email, and can handle MIME. Support for IDN (Internationalized Domain Names) is included. Through its modular design, various new functions (like RSS, personal file storage, a bookmark manager, etc.) are easily included.

OLED Display
- Other Apparel: Geek Belt Buckles
- Gadgets: Green Laser Presentation Remote
- Gadgets: OHSO Pocket Toothbrush
- Electronics: Philips Universal Remote Control
- Tshirts: Save the Princess
- Tshirts: e By Numbers
- Geek Toys: World of Warcraft Collectible Card Game
- Geek Toys: Crossbow X2
- Home & Office: Planetary Orbit Clock

Changes: This release improved the handling of POP3 errors. Instead of an alert box, the status bar now changes to reflect the error. The mail parser now handles incorrectly encoded mail better - it can now render 8-bit header lines correctly, as long as there is a charset definition for the mail. External mail notification of calendar events has been repaired.
