

# ZeroDomains

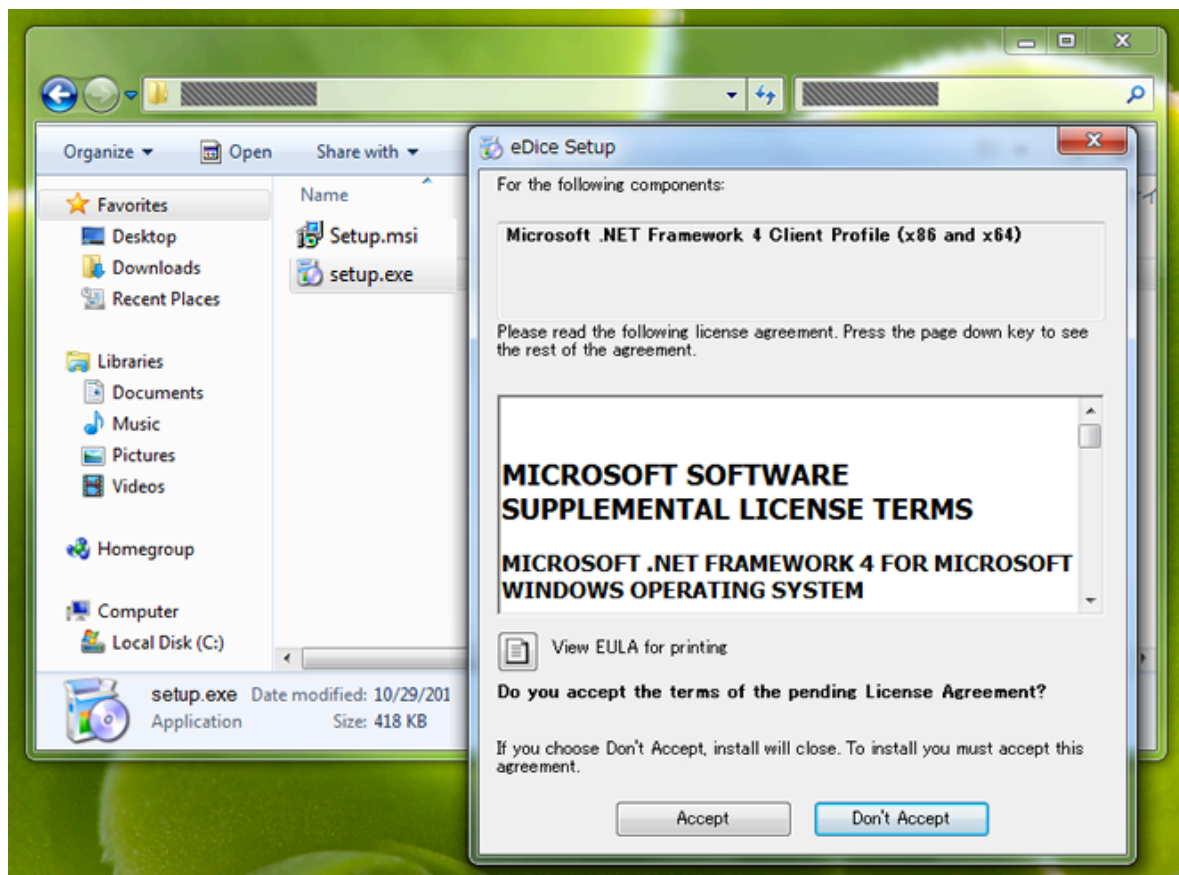

Thank you for your using ZeroDomains.

## 1. Introduction

**ZeroDomains** offers a quick way of finding out domain registration status, covering more than 650 top-level domains. Simply, enter a name without a TDL (top-level domain). Then create a list of TDLS (without a period). And? Just click on the Go button. And ZeroDomains will take care of the rest. If the name of a domain in the list appears in red, then it's already been taken. If a domain appears in black, then it's still available.

## 2. Installing ZeroDomains

Double-click on **setup.exe** in the delivery package initiate the installation process. If your computer doesn't have it yet, ZeroDomains will first attempt to install **.NET Framework 4**, and you will be prompted for confirmation. (See Screenshot 2.) Then you will proceed to install ZeroDomains. You can use **Setup.msi** to install the application as long as you already have .NET Framework 4, which ZeroDomains requires. You can find the application at the following path: C:\Program Files\MacHouseZeroDomains.

### 3. Uninstalling ZeroDomains

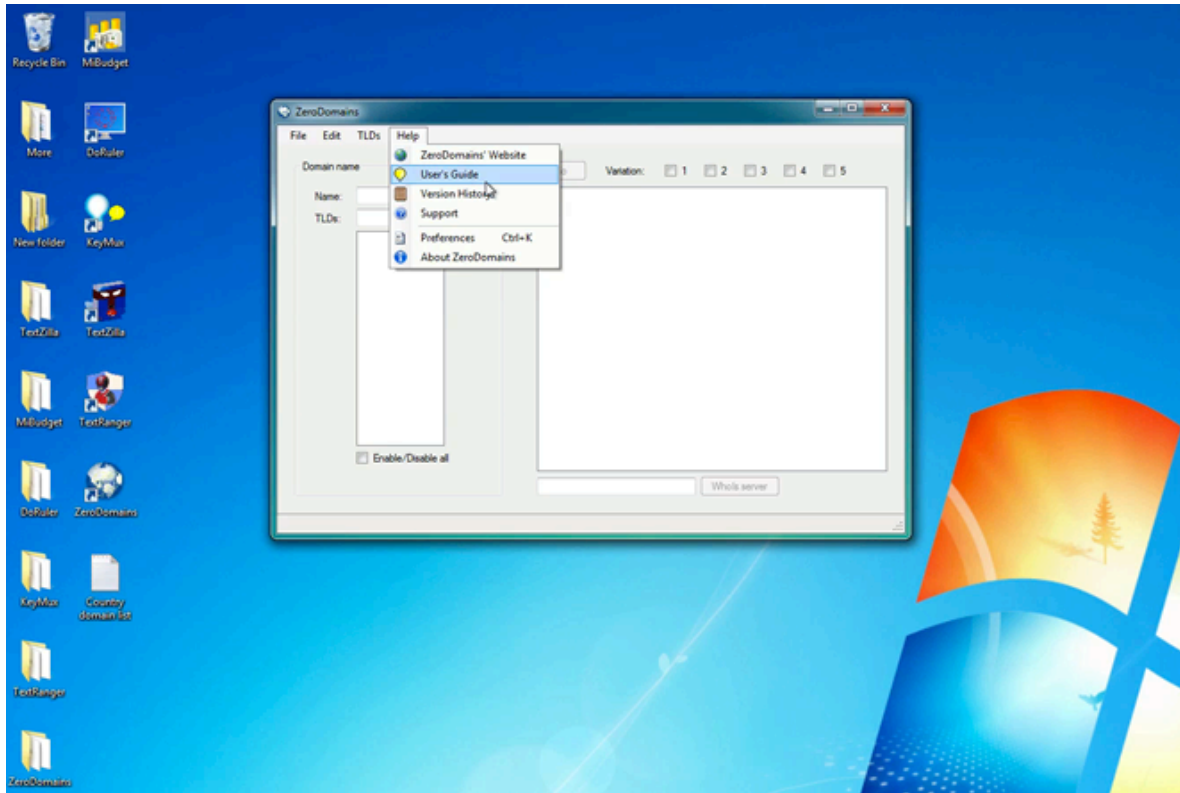

Open Control Panel and choose Uninstall a program. Then double-click on ZeroDomains to initiate the uninstalling process. (See Screenshot 3.) You can also use the original setup.exe or setup.msi to uninstall the application. (See Screenshot 4.) Additionally, when it starts up for the first time, the application will create a folder, which you need to manually trash. You can locate it easily by opening Preferences and navigate to the System tab.
